

## **Duct System / Leakage Of Your Ducts**

In reality, a typical residential duct system in the United States has many leaks in both the supply and return sides of the system. This means that the air handler/blower pulls air not only from the return grills in the house, but also from the basement, crawlspace, attic, garage or anywhere else along their route. Duct leakage can have many consequences. Heating and cooling your attic or basement is an obvious one that increases your utility costs. That same air may also be contaminated with dust mold, moisture and toxins such as pesticides from insect treatments, combustion gases and even radon. Protecting your health is a good reason for sealing ducts. The energy savings are usually rewarding as well. Our technician will pressure test your ducts and help you to determine where the leaks are and provide information on how to fix them.
