

## **Moisture / Excess Moisture**

Too much moisture in your home can reduce its durability and your comfort. Though some moisture is normal in every home, excess moisture can accumulate and cause numerous problems. It encourages the growth of mold, mildew and other organisms, which can cause health concerns like allergies and asthma. Excess moisture in the basement or crawlspace is of particular concern to both the structure and the health of the occupants. High levels of moisture in this area usually leads to damage of the floor system that are typically very expensive repairs. Excess moisture and water in this area is also a hidden health concern. Most of our heating and air conditioning equipment is located in this area resulting in nearly perfect distribution of mold or other bacteria through out the home. Are you noticing musty odors, see dark stains on wall or ceilings or actually seeing mold on things in your home? The source of excess moisture should be investigated by one of our professionals so corrective measures can be taken.
